
Polysulfide Technology

Think Fly and Think Tick both use Polysulfide technology in their formulations instead of the reliance of a chemical approach.

Harnessed in the correct manner using patented technology, the Think products Polysulfide's are a natural and exceptionally powerful extraction from the plant world, often referred to as nature's strongest defense.

Mild processing of extracts containing allicin (thiosulphinates) produces a group of reduced organo-sulphur molecules with a set blueprint of sulfur chain lengths and mixtures of methyl and allyl functional groups at the end of the sulfur chains. Our production facilities are able to reproduce this same polysulfide fingerprint over and over again meaning that we can guarantee nature's technology in a way no other manufacturer can.

The biological activity of Think Fly and Think Tick is driven by these mostly diallyl polysulfide's which will impact the target parasite.

This activity is as a result of over 15 years of research and development. As a result, Think products are world-unique and lead the way in fighting parasite in line with the aim of forward thinking organisations.
